

Lab 4: Symmetric & Asymmetric Cryptography

The purpose of this lab is to implement **both symmetric and asymmetric cryptographic techniques**, including:

- AES (Advanced Encryption Standard) – Symmetric key algorithm
- RSA (Rivest–Shamir–Adleman) – Asymmetric key algorithm
- Digital Signature and Verification using RSA
- File hashing using SHA-256
- Performance benchmarking by varying key sizes (N) and plotting timing graphs

Execute the Program

1. Install Packages

```
pip install pycryptodome matplotlib
```

2. Generate Keys

```
python3 crypto.py genkeys
```

By this command

- AES-128 key file → `aes_key_128.bin`
- AES-256 key file → `aes_key_256.bin`
- RSA private/public key pair → `rsa_private.pem`, `rsa_public.pem`

3. AES Encryption & Decryption

Encryption:

```
python crypto.py aes encrypt --mode ECB --size 128 -i plain.txt  
-o cipher.bin
```

Decryption:

```
python crypto.py aes decrypt --mode ECB --size 128 -i cipher.bin  
-o decrypted.txt
```

You can also use **CFB** mode instead of ECB:

```
python crypto.py aes encrypt --mode CFB --size 256 -i plain.txt  
-o cipher.bin
```

4. RSA Encryption & Decryption

Encryption:

```
python crypto.py rsa encrypt -i plain.txt -o rsa_cipher.bin
```

Decryption:

```
python crypto.py rsa decrypt -i rsa_cipher.bin -o  
rsa_decrypted.txt
```

5. Digital Signature & Verification

Sign a file:

```
python crypto.py sign -i plain.txt -o signature.bin
```

Verify the signature:

```
python crypto.py.py verify -i plain.txt -s signature.bin
```

6. Hashing (SHA-256)

```
python crypto.py.py hash -i plain.txt
```

Will display the SHA-256 hash value of the file.

7. Benchmarking

Command:

```
python crypto.py.py bench
```

This will:

- Vary AES and RSA key sizes (N)
- Measure encryption/decryption times

```
(venv) tajwar46@DESKTOP-5NQP60I:~/INS_LAB/Lab4$ python3 crypto.py bench
Starting AES benchmark (deriving AES key from N bits of entropy)
AES N=16 bits: avg time 0.008398s over 3 runs
AES N=64 bits: avg time 0.006982s over 3 runs
AES N=128 bits: avg time 0.006259s over 3 runs
AES N=256 bits: avg time 0.042949s over 3 runs
Starting RSA benchmark (key generation + encrypt/decrypt of small message)
```

Functionalities

Functionality	Description
AES Encryption/Decryption	Supports 128-bit and 256-bit keys in ECB and CFB modes
RSA Encryption/Decryption	Uses PKCS1_OAEP for secure asymmetric encryption

RSA Signature & Verification	Implements SHA-256 hashing with PKCS#1 v1.5 signature
SHA-256 Hashing	Computes and prints hash of any file
Key Generation	AES keys (random bytes) and RSA key pair (2048 bits)
Benchmarking	Measures execution time for varying N and plots graphs

Output

```
(venv) tajwar46@DESKTOP-5NQP60I:~/INS_LAB/Lab4$ python3 crypto.py aes encrypt --mode ECB --size 128 -i plain.txt -o cipher.bin
python3 crypto.py aes decrypt --mode ECB --size 128 -i cipher.bin -o decrypted.txt
AES encrypt (128, ECB) done in 0.000591 seconds. Output: cipher.bin
AES decrypt (128, ECB) done in 0.000628 seconds. Output: decrypted.txt
(venv) tajwar46@DESKTOP-5NQP60I:~/INS_LAB/Lab4$ python3 crypto.py rsa encrypt -i plain.txt -o rsa_cipher.bin
python3 crypto.py rsa decrypt -i rsa_cipher.bin -o rsa_decrypted.txt
RSA encrypt done in 0.003578 seconds. Output: rsa_cipher.bin
RSA decrypt done in 0.031318 seconds. Output: rsa_decrypted.txt
(venv) tajwar46@DESKTOP-5NQP60I:~/INS_LAB/Lab4$ python3 crypto.py sign -i plain.txt -o signature.bin
python3 crypto.py verify -i plain.txt -s signature.bin
Signature generated in 0.029372 seconds. Signature file: signature.bin
Verification returned True in 0.003047 seconds.
(venv) tajwar46@DESKTOP-5NQP60I:~/INS_LAB/Lab4$ python3 crypto.py hash -i plain.txt
SHA-256(plain.txt) = e9c44d5effd1bc64980d9cafa8020ce7f3fe25193acfde014c924ed1c5da9d4c
```
